

ABSTRACT OF THE DISCLOSURE

5 ⁵⁰⁴_{B37} According to the present invention, provided is an HTML display device whereby there can be reduced a waiting time for connection to a site on a network where HTML data is held; time and effort for communication over a plurality of sites; and a communication cost.

10 A hypertext display device of the present invention has user interface (a designating unit) for designating an object (informing data) such as a link text attached with an underline which is contrived for telling an user of the presence of link information in HTML data. When an object is designated by the user interface, information which shows a location of the displayed HTML data including the object is acquired by a first
15 information acquiring unit and link information designated by the user interface is acquired by second information acquiring unit. Both acquired information is stored in a table in a pair. The displayed HTML data themselves and the HTML data indicated by the link
20 information are sequentially acquired by data acquiring unit referring to the table and then stored in data storage unit.
